Other Site Characteristics

Representa el tramo final del río Mijares, en cuya desembocadura se formó un pequeño delta. El cauce circula dentro de unos diques elevados artificialmente con materiales propios de la zona (cantos rodados), estando la mayor parte de la superficie restante cubierta por amplias extensiones de grava con vegetación anual. En el último kilómetro de río se desarrollan carrizales donde la lámina de agua es más constante.

4.2 Quality and importance

Alberga poblaciones nidificantes de 5 especies de aves acuáticas incluidas del Anexo I, e invernán de forma regular hasta 5 especies del mismo anexo. Ha tenido importancia regional para el Chorlitojeo Patinegro y Cigüeñuela Común, aunque cambios recientes en la morfología del cauce han mermado las características del entorno para la nidificación de estas aves desde 2003. Zona de paso e invernada para diversas especies de aves acuáticas, si bien sus poblaciones son poco relevantes respecto a los totales nacionales. Los

rangos de las poblaciones de aves reflejadas en el apartado 3.2 muestran los contingentes mínimos y máximos registrados en el periodo 2003-2008, elaborados a partir de censos oficiales.
