### Other Site Characteristics

Representado por una extensión de marjales y cultivos abandonados en el torno de la actividad industrial del puerto de Sagunto. Parte de los terrenos estaba ocupada por una siderúrgica, cuyos vertidos de escoria en el litoral hicieron progradar la costa considerablemente. Esa escoria se ha compactado y endurecido, creando una especie de acantilados bajos que confiere a las playas un aspecto artificial. La zona es propiedad de la Generalitat Valenciana.

### 4.2 Quality and importance

A pesar de su pequeña extensión, constituye un área de gran importancia para la fauna acuática, destacando sus poblaciones de samaruc (*Valencia hispanica*) y fartet (*Aphanius iberus*) y de galápago europeo (*Emys orbicularis*). Igualmente, debe destacarse su importancia para las aves acuáticas. Alberga poblaciones nidificantes de 14 especies de aves acuáticas incluidas del Anexo I, e invernán de forma regular hasta 12 especies del mismo anexo. Destacan las poblaciones reproductoras de Fumarel Cariblanco (22,7% del total en la Comunidad Valenciana), Focha Moruna (22,7%), Calamón Común (13,6%) y Canastera Común (16,3%). Existen indicios de nidificación de Avetoro común. Los rangos de las poblaciones de aves

reflejadas en el apartado 3.2 muestran los contingentes mínimos y máximos registrados en el periodo 2003-2008, elaborados a partir de censos oficiales.
